

FACET

RIBBON BLENDER

Ribbon blenders are common industrial mixing machines, used extensively across many industries for blending and mixing dry powders, granules, pellets and flakes. Paddle Mixers are most commonly used to mix animal feed and related products.

Facet Ribbon Blenders consist of a U-shaped horizontal trough fitted with a horizontal longitudinal shaft on which arms are mounted, supporting a combination of ribbon blades, paddles or helical screws set at a fairly close clearance to the trough so that all product is evenly mixed.
